Abstract Eleven species of the chrysomelid subfamily Donaciinae were recorded from Hokkaido: *Plateumaris constricticollis* (JACOBY), *P. weisei* (DUVIVIER), *P. sericea* (LINNAEUS), *P. shirahatai* KIMOTO, *Donacia splendens* *splendens* JACOBSON, *D. tominagai* HAYASHI, *D. japana* CHÛJÔ et GOECKE, *D. sparganii gracilipes* JACOBY, *D. vulgaris* ZSCHACH, *D. lenzi* SCHÖNFELDT and *D. provostii* FAIRMAIRE. Of these, *P. constricticollis*, *P. sericea*, *D. sparganii gracilipes* and *D. vulgaris* are distributed in the Kuril Islands. *Plateumaris amurensis* WEISE is known from Kunashiri Is.

The chrysomelid subfamily Donaciinae includes about 20 Japanese species in three genera. KIMOTO (1994) reviewed the Japanese Donaciinae and recognized ten species from Hokkaido. Of these, four species were recorded from the southern Kuril Islands (MEDVEDEV, 1992). From 1989 to 1999, we surveyed distribution of Donaciinae in Hokkaido, and also examined specimens from Hokkaido and the southern Kuril Islands deposited in the Systematic Entomology, Hokkaido University, Sapporo [SEHU], the National Science Museum, Tokyo [NSMT], the Osaka Museum of Natural History [OMNH] and the Museum of Nature and Human Activities, Hyôgo [HYO]. We recognize 11 species from Hokkaido and show their distribution in Figs. 2 to 11.

We gratefully acknowledge our indebtedness to Dr. Masahiro ÔHARA (SEHU), Dr. Syûhei NOMURA (NSMT), and Mr. Shigehiko SHIYAKE (OMNH) for allowing access to the referred materials.
