# A New Subspecies of *Carabus (Apotomopterus) vitalisi* (Coleoptera, Carabidae) from Northeast Laos

## Yûki Imura

Department of Gynecology, Tôkyû General Hospital, Kita-senzoku, 1–45–6, Ôta-ku, Tokyo, 145–0062 Japan

**Abstract** A new subspecies of *Carabus (Apotomopterus) vitalisi* is described from Northeast Laos under the name of *C. (A.) v. phoopanensis* nov.

Carabus vitalisi was described by Lapouge (1916, pp. 85–87) from "Xieng Khouang, au sommet du col en allant à Ban-Ninh" of centro-northern part of Laos, and is known to be a sole component of the subtribe Carabina occurring in that country, though not strictly endemic but also recorded from the northwestern part of North Vietnam. The Vietnamese race is represented by subsp. *mourzinei* Deuve et Imura, 1993.

At the beginning of 2000, Mr. Satoshi Koiwaya made an investigation mainly for the theorine butterflies on the northern slope of Mt. Phoo-Pan in Xam-Nua (=Sam-Neua) Province of Northeast Laos and succeeded in collecting a series of Lapouge's species. The Phoo-Pan form differs in details from both of the two known races, and I am going to describe it as a new subspecies in the following lines.

I am grateful to Mr. Satoshi Koiwaya who kindly submitted all the specimens to me for study, and to Mr. Hiroyuki Wakahara who supported Koiwaya's work in the field. My special thanks are due to Dr. Shun-Ichi Uéno of the National Science Museum, Tokyo, for kindly reading the manuscript of this paper.

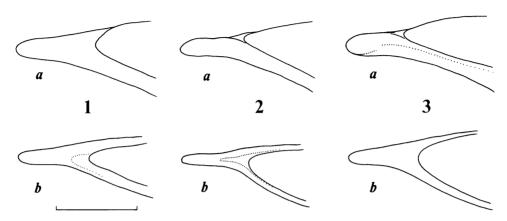

## Carabus (Apotomopterus) vitalisi phoopanensis IMURA, subsp. nov.

(Figs. 2, 4)

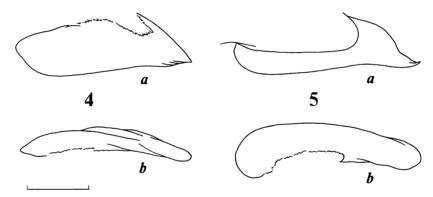

Length: 30.0–34.5 mm (including mandibles).

This new subspecies is most closely allied to the nominotypical form, but is distinguishable from the latter by the following points: 1) a little smaller in size and slenderer in proportion; 2) pronotum a little narrower and more strongly contracted towards hind angles which are a little more strongly protrudent posteriad and more sharply pointed at tips; 3) elevated parts of elytral intervals a little less prominently raised; 4) apical part of aedeagus apparently narrower and slenderer, weakly but obviously constricted at basal third in dorsal view, and triangularly depressed on the dorsal

Figs. 1–3. Apical part of aedeagus of *Carabus (Apotomopterus) vitalisi* subspp. —— 1, Subsp. *vitalisi* from Xieng Khouang (lectotype); 2, subsp. *phoopanensis* nov. from Mt. Phoo-Pan (holotype); 3, subsp. *mourzinei* from Shonla (holotype); a, right lateral view; b, dorsal view. Scale: 1 mm.

Figs. 4–5. Spinula of *Carabus (Apotomopterus) vitalisi* subspp. —— 4, Subsp. *phoopanensis* nov. from Mt. Phoo-Pan (holotype); 5, subsp. *mourzinei* from Shonla (holotype); a, dorsal view; b, basal lateral view. Scale: 0.5 mm.

surface near the base. From subsp. *mourzinei*, this new subspecies is readily discriminated by more shiny body, much narrower and less transversely wrinkled pronotal disc, slenderer elytra with the tertiary intervals not forming interrupted carinae, and differently shaped aedeagal apex and spinula as shown in Figs. 2–5.

Type series. Holotype:  $\delta$ , northern slope of Mt. Phoo-Pan, 1,500–2,000 m in alt., in Xam-Nua (=Sam-Neua) Prov., Northeast Laos,  $18\sim25$ –I-2000, S. Kolwaya leg., in coll. Department of Zoology, National Science Museum (Nat. Hist.), Tokyo. Paratypes (including allotype):  $20\delta\delta$ , 19, same data as for the holotype, in coll. Y. IMURA.

Specimens examined for comparative study. Nominotypical subspecies:  $\delta$ ,

K. MIZUSAWA.

*Notes*. All the specimens of the type series of the present new subspecies were collected from along the path between the village of Selui and the summit of Mt. Phoo-Pan. They were under hibernation and dug out either from the soil or from decayed trunks lying on the floor of the virgin forest consisting of evergreen broadleaved trees partly mixed with certain kind of cypress.

要 約

12 Yûki Imura

ムネワ(サムヌーア)省のPhoo-Pan 山北麓から採集されたヴィタリストゲオサムシを新亜種と認め、subsp. *phoopanensis* nov.として記載した.既知の2亜種からは、体形や上翅彫刻、 $\delta$ 交尾器形態の違いにより識別される.

# Additions to the Edible Beetles (Coleoptera) from Northern Thailand

## Yuka Utsunomiya<sup>1)</sup> and Kimio Masumoto<sup>2)</sup>

 Graduate School of Home Economics, Otsuma Women's University, Tokyo, 102–8357 Japan
 Institute of Human Living Sciences, Otsuma Women's University, Tokyo, 102–8357 Japan

We have been studying edible beetles from northern Thailand and published our papers in the Elytra, Tokyo (1998, **26**: 443–445; 1999, **27**: 191–198). In addition, we have collected and determined some more species as given blow:

## Family Scarabaeidae

## Laparosticiti

Onthophagus (Serrophorus) seniculus (FABRICIUS)

#### Pleurosticti

Anomala parallera Benderitter
A. blaisei Ohaus
A. cantori Hope
A. fusikibia Lin
A. rugosa Arrow
A. punctulicollis Fairmaire

A. blaisei Ohaus
A. fusikibia Lin
Empectida tonkinensis Moser

We wish to express our gratitude to Messers. Kaoru Wada, Joetsu Educational University and Takeshi Itoh of Osaka City for taking trouble to determine the above species.
