

An Additional Record of *Schmidtiana shinkaii*  
(Coleoptera, Cerambycidae)

**Haruki KARUBE**

Kanagawa Prefectural Museum of Natural History, 499, Iryuda, Odawara,  
Kanagawa Pref., 250-0031 Japan

*Schmidtiana shinkaii* KARUBE was originally described on the basis of a single male specimen collected on the Dalat Highlands (ca. 1,200 m in alt.), in Lam Dong Province of southern Vietnam. Recently, I have examined an additional male specimen collected at Bao Loc to the northeast of Ho-chi-minh of southern Vietnam. I will record it below.

*Specimen examined.* 1♂, Bao Loc, Lam Dong Prov., S. Vietnam (ca. 700 m in alt.), IV-1998, local collector leg.

This specimen has rather spread dark purple markings at the apical part of the elytra, and relatively short lateral spines of the pronotum as compared with the type specimen. The body length of this additional specimen is 43.4 mm.
