

Additional Record of *Eucurtiopsis ohtanii* (Coleoptera, Histeridae, Chlamydopsinae) from Kyushu, Japan

Shûhei YAMAMOTO

Faculty of Agriculture, Kyushu University, Fukuoka, 812-8581 Japan

The genus *Boreochlamydes* was defined by SAWADA (1994) with the type species *B. ohtanii* from Ôita and Mie, Japan. Later, ÔHARA (1994) transferred this species to the genus *Eucurtiopsis*. The species of this genus are recorded from Japan and Taiwan. Up to the present, two species of the genus have been known from Japan. Of these, *E. ohtanii* is known as myrmecophile associated with *Pheidole ferdida* SMITH, 1874 (ÔHARA, 1994) and have hitherto been known from Honshu and Kyushu, Japan (SAWADA, 1994; ÔHARA, 1994; NOMURA *et al.*, 2006, etc.). Recently, I had an opportunity to examine one individual of the histerid beetle collected from Kyushu.

In this brief paper, I will report the second record of this species from Kyushu.

I am deeply indebted to Mr. Toshiharu MITA and Shinsuke SATO (Kyushu Univ.) for supplying me with the invaluable specimen and to Dr. Munetoshi MARUYAMA (Kyushu Univ. Mus.) for his critical reading of this draft. I also thank Dr. Masahiro ÔHARA (Hokkaido Univ. Mus.) for his kind advice.

*Eucurtiopsis ohtanii* (K. SAWADA, 1994)

*Specimen examined.* 1 ex., Hiko-san (640 m alt.), Soeda-machi, Fukuoka Pref., Japan, 26-V to 5-VI-2008, T. MITA & S. SATO leg., by Malaise trap (deposited in the author's collection).

*Remarks.* New record from Fukuoka Pref. *Pheidole ferdida*, a symbiotic host ant, is widely distributed in Kyushu. It suggests that this species will be discovered from the other areas of Kyushu.
